Education

- Participated in the HeGUTTS Fellowship, learning Quantum Computing alongside 23 fellows (5 onsite participants).
- Coursework and practical exercises explored Quantum Machine Learning (QML) models, hybrid quantum-classical algorithms, variational circuits, and quantum optimization methods.
- Focused on practical implementation of Shor's Algorithm, Grover's Search, and Quantum Neural Network architectures using Qiskit and Python.

Skills

Programming: Python

Web & API Development: Django, REST APIs

Quantum Computing Frameworks: Qiskit, PennyLane (introductory projects)

Libraries & Tools: NumPy, Pandas, Plotly, Seaborn, Matplotlib, Data Visualization •

Other: Exploratory Data Analysis, Quantum Machine Learning concepts, Basic Quantum Algorithms, Machine Learning foundations

Projects

Diamond Prices Analysis & Visualization - Performed exploratory data analysis (EDA) on diamond prices dataset. - Built interactive visualizations using Plotly and Seaborn to uncover pricing patterns.

COVID-19 India Analysis - Collected, cleaned, and analyzed COVID-19 datasets. - Developed visual dashboards showing trends and key statistics using Python visualization libraries.

Student Performance Analysis - Analyzed student performance datasets. - Created visual dashboards and charts to highlight insights and metrics.

Cooperative System Management (Python Project) - Developed a Python-based system for cooperative management. - Included modules for member registration, transaction tracking, and reporting with API integrations for external systems.

Loan & Management System (Django Application) - Built a full-stack Django web application for loan management. - Heavily utilized REST APIs for account handling, loan processing, and real-time data updates. - Integrated backend services and database operations to support scalable functionality.

Quantum Computing Mini-Projects - Implemented **k-fold cross-validation experiments** on sample quantum circuits using Qiskit. - Studied the effect of quantum gates on qubit states and explored **state visualization techniques**. - Applied **QML techniques** for basic classification tasks and small-scale quantum algorithm simulations, including **Shor's Algorithm and Grover's Algorithm**.

Objective

Aspiring quantum computing intern eager to contribute to Xanadu's software and educational projects. Experienced in Python programming, Django web development, REST APIs, data visualization, and exploratory data analysis. Hands-on exposure to quantum computing through the HeGUTTS Fellowship, with practical work on QML techniques, Shor's Algorithm, Grover's Algorithm, and quantum circuit visualization.
